SAFETY INSTRUCTIONS

SAFETY CHECK AFTER SERVICING

Confirm the specified insulation resistance between power cord plug prongs and externally exposed parts of the set is greater than 10 Mohms, but for equipment with external antenna terminals (tuner, receiver, etc.) and is intended for [C] or [A], specified insulation resistance should be more than 2.2 Mohms (ground terminals, microphone jacks, headphone jacks, line-in-out jacks etc.)

PRECAUTIONS DURING SERVICING

1. Parts identified by the \triangle symbol parts are critical for safety.
Replace only with parts number specified.
2. In addition to safety, other parts and assemblies are specified for conformance with such regulations as those applying to spurious radiation. These must also be replaced only with specified replacements.
Examples: RF converters, tuner units, antenna selector switches, RF cables, noise blocking capacitors, noise blocking filters, etc.
3. Use specified internal wiring. Note especially:
 - 1) Wires covered with PVC tubing
 - 2) Double insulated wires
 - 3) High voltage leads
4. Use specified insulating materials for hazardous live parts. Note especially:
 - 1) Insulation Tape
 - 2) PVC tubing
 - 3) Spacers (Insulating Barriers)
 - 4) Insulation sheets for transistors
5. When replacing AC primary side components (transformers, power cords, noise blocking capacitors, etc.), wrap ends of wires securely about the terminals before soldering.

6. Observe that wires do not contact heat producing parts (heatsinks, oxide metal film resistors, fusible resistors, etc.).
7. Check that replaced wires do not contact sharp edged or pointed parts.
8. Also check areas surrounding repaired locations.
9. Use care that foreign objects (screws, solder droplets, etc.) do not remain inside the set.

4. AUTO TUNING SYSTEM DESCRIPTION

The reference tape being used by AKAI has characteristics that are most common with tapes currently available on the market.

With due consideration given to the difference in characteristics between tapes, it has been found that correction of ± 9.6 dB can be made with reference to the center value by providing 64 steps (0.3 dB per step) and that a variety of tapes can be supported by performing tape tuning.

The auto tuning involves:

- 1) Level adjustment
- 2) Bias adjustment
- 3) Equalizer Middel (EQM) adjustment
- 4) Equalizer High (EQH) adjustment

The level and equalizer adjustments are made in 64 steps (0.3 dB per step).

4-1. Auto Tuning Procedure

- 1) Insert the tape.
- 2) Detect the pack and tape type (auto tape selector).
- 3) The TEST start switch ON.
- 4) Detect the auto tuning bias level.
- 5) Perform REC/PB for the reference signal and determine whether the portion of tape is leader tape or one coated with magnetic material.
 - (a) In the case of leader tape, the error detection is followed by 64-count FF before tuning is started (REC PLAY MODE).
 - (b) If the portion is coated with magnetic mate-

rial, tuning is started immediately (REC PLAY MODE).

- 6) Make a coarse adjustment of REC/PB level. (Lch & Rch)
- 7) Make bias adjustment. (Rch only)
- 8) Make a fine adjustment of REC/PB level. (Lch and Rch).
- 9) Adjust the equalizer. (Lch and Rch)
- 10) If the above adjustments have been made satisfactorily, then rewind the tape back to the start point and establish the "READY standby" state via Rec/Pause.
- 11) If an error occurs during the tuning procedure, first perform the FF operation and then repeat the adjustments in 6) through 9).
- 12) If an error still occurs, then rewind the tape back to the start point and establish the STOP mode with ERROR displayed.

4-2. After Tuning

With "READY" displayed, it is possible to perform REC/PLAY directly with the data associated with the test.

The READY state is not cancelled, whichever operation key is depressed, unless the tape is changed or the TEST key is depressed again.

The data associated with the test can be written into any of the channels (memory 1 through 4).

Because of use of CMOS RAM and Ni-Cd batteries, the memory contents can be preserved for more than 20 days even if the power is turned off.

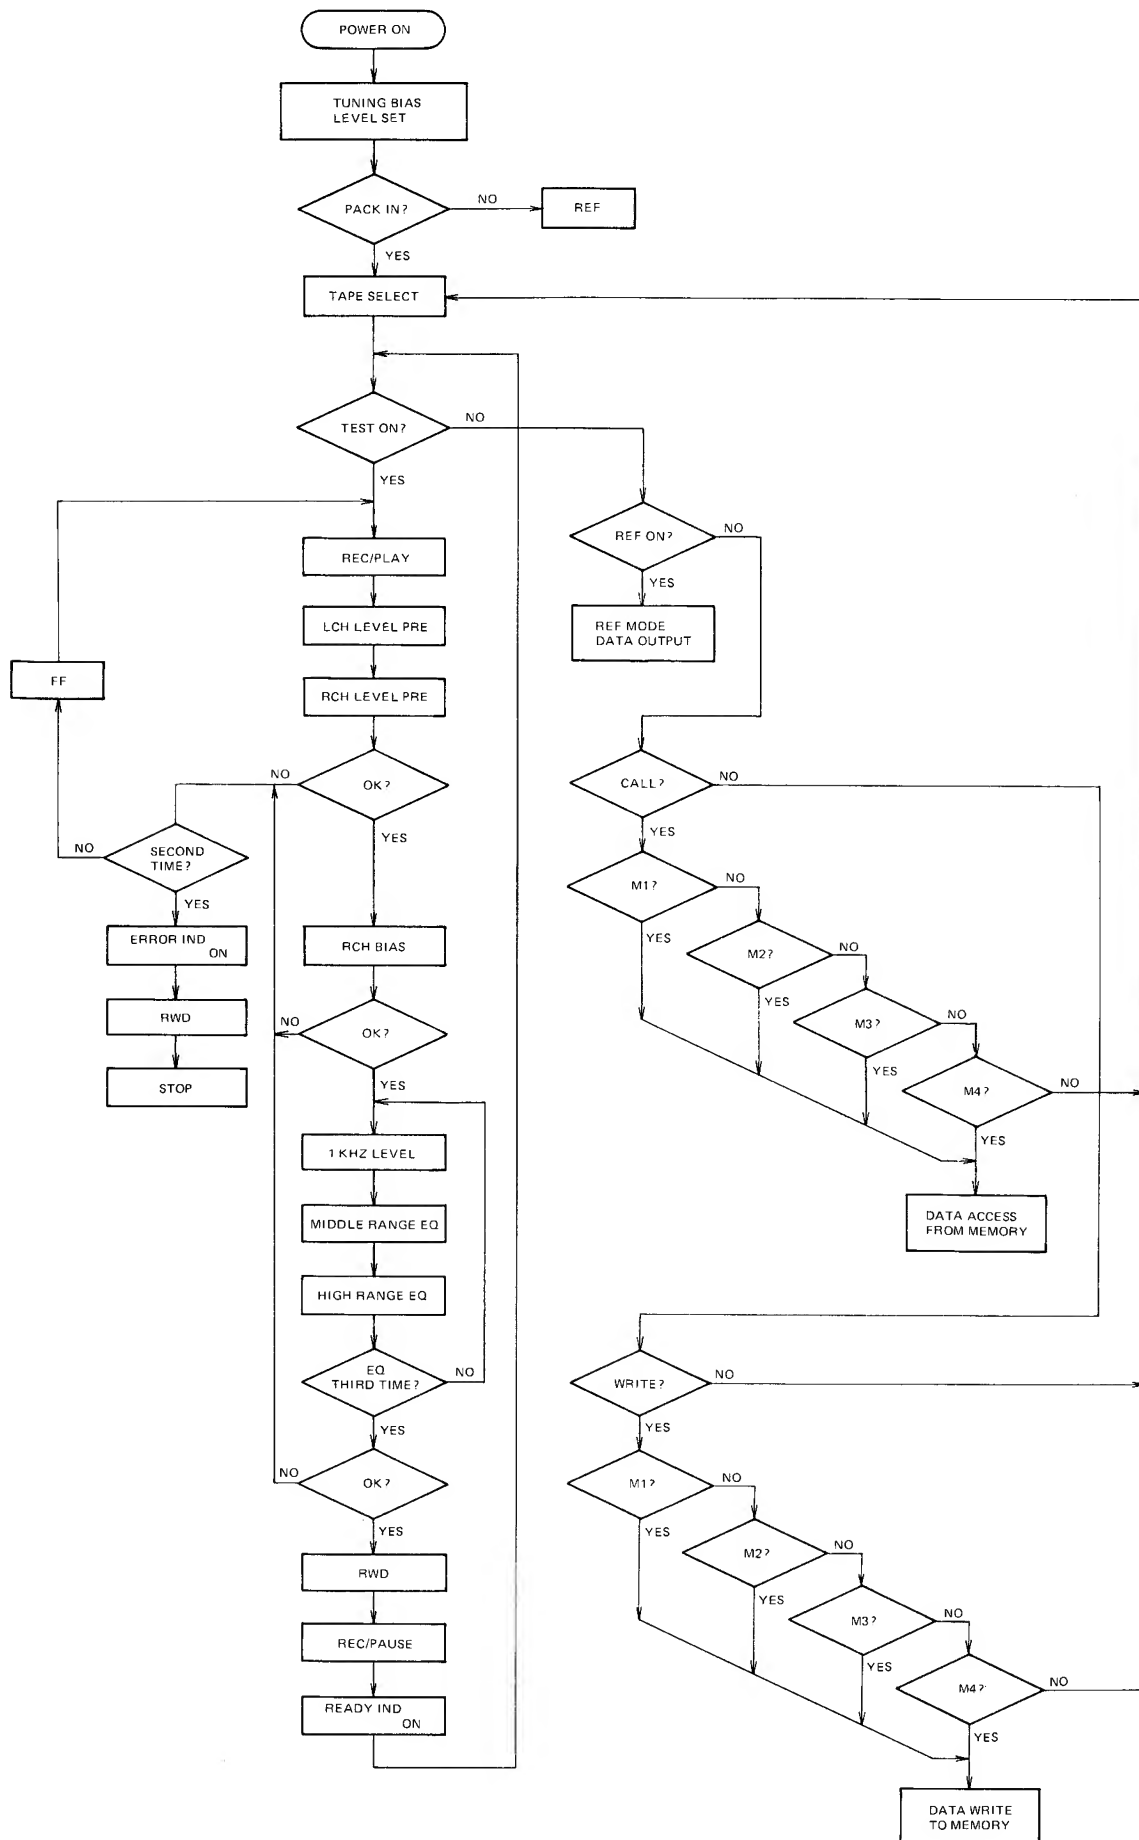

Fig. 1-5 Outline Flow Chart of Auto Tuning System

Fig. 1-6

Fig. 1-7

Fig. 1-8

4-3. Coarse Adjustment of REC/PB Levels (Refer to Figs. 1-6, 7)

The coarse level adjustment is made first on Lch and then on Rch.

A 1 kHz signal is recorded and played back with the standard REF value ($R_4 \sim R_9$: 100000, -27 VU), and the REC/PB level is subjected to A/D conversion and then compared with the REF value. The difference is then added to the REF value, the result of which is used as the REF value (level) for the next test. Figure 1-6 shows the REC/PB timing.

With the lapse of 109 msec after the recording, the PB output is made available. This output is compared in IC13 and then subjected to A/D conversion as test data to compute the difference (the number of steps) from 100000. For example, if the test data is 100011, the difference is 3 steps and thus it is necessary to set to the value (011101) which is the result of subtracting 3 (steps) from the recording

data. This data is routed via a switch (IC2) to IC11 to analog-hold it there. (See Figure 1-7.)

4-4. Bias Tuning (Refer to Figs. 1-8, 9, 10)

- 1) For bias tuning, a 1 kHz signal is recorded at a level obtained through the coarse level adjustment. The equalizer setting must be made with the reference data prior to recording.
- 2) For bias, continuous 16 step recording must be made at intervals of 4 steps, starting at 000000. One step takes 60 msec.
- 3) Figure 1-8 shows the REC/PB timing.

The REC bias data is switched 1 msec after the end of "a". The sample-holding of the PB signal takes place during "c". In "d", the PB level is subjected to A/D conversion, and the level associated with each step is determined within the Mi-Com.

Fig. 1-9

- 4) The 16 step REC/PB is carried out twice and the average of the peak values is computed.
- 5) The range over which the amount of bias varies in ± 16 steps is determined, with the computed average value being at the center.
- 6) Recording and playback is made twice on a per-step basis, starting at the "lower" end of the variation range. Then, the average of the peak values in 32 steps is computed.
- 7) The value which is 4 steps higher than the data obtained by the fine adjustment is used as the bias setting.
- 8) Head Room adjustment system
The bias setting can be varied by means of the AT bias volume (VR 901) on the front panel. The AT bias set point is detected each time the test is started, thereby determining the number of excess steps. Figure 1-10 gives the change rate.

Change rate		Upon completion of tuning
Step	[%]	Step Over
+7	+21	10
+6	+18	9
+5	+15	8
+4	+12	7
+3	+9	6
+2	+6	5
+1	+3	4
0	0	4
-1	-3	4
-2	-6	3
-3	-9	2
-4	-12	1
-5	-15	0
-6	-18	-1
-7	-21	-2

If the change rate is 3% per step, then a change of $\pm 21\%$ can be achieved.

Fig. 1-10

Fig. 1-11

4-5. Level Tuning (Refer to Fig. 1-11)

- 1) A 1 kHz signal is recorded and played back with the data (011101) obtained in the coarse level adjustment and the difference from the original REF value (100000) is determined, which is then added to the first recording level data. The result is then used as the second recording level data.
- 2) The same test is further repeated twice (i.e., a total of three tests are to be conducted.)
- 3) If after three tests the data obtained is outside the specified range, two additional tests need to be conducted.
- 4) If the data is still out of the specified range after the fifth recording/playback, an error is assumed.
- 5) If "Dolby ON" is detected, Δlevel is reduced to 1/2, and $\Delta\text{level}/2$ is used as the amount of level correction (α).

4-6. Equalizer Tuning

- 1) The proper level must be set through recording and playback with 7 kHz (middle range), and 14 kHz (high range, with normal tape) or 15 kHz (high range, with CrO₂ or metal tape).

- 2) The REF value used is 100000.

- 3) In addition, the information in 4-5 "Level Tuning" also applies here.

4-7. Mute Circuit (During Tuning)

(Refer to Fig. 1-12)

When the test key is depressed, the Mi-Com enters the test mode with its pin ⑫ set to "H". This activates TR11 and TR12 on the meter drive PCB, which in turns on TR45 and TR47 (on the Pre Amp PCB) via D17 and D18, thereby causing the gates of TR44 and TR46 to be at negative voltage. As a result, both TAPE and SOURCE are shut off. Thus, the test signal is muted and therefore not made available at the LINE OUT during the test.

On the other hand, when pin ⑫ of Mi-Com goes to "H", TR1 of the Pre Amp is activated, causing the Rec input (Line/DIN) to go to ground. In addition, TR2 is turned on, deactivating TR3. As a result, the test signal from TEST OSC is supplied to the Rec Line Amp via R9.

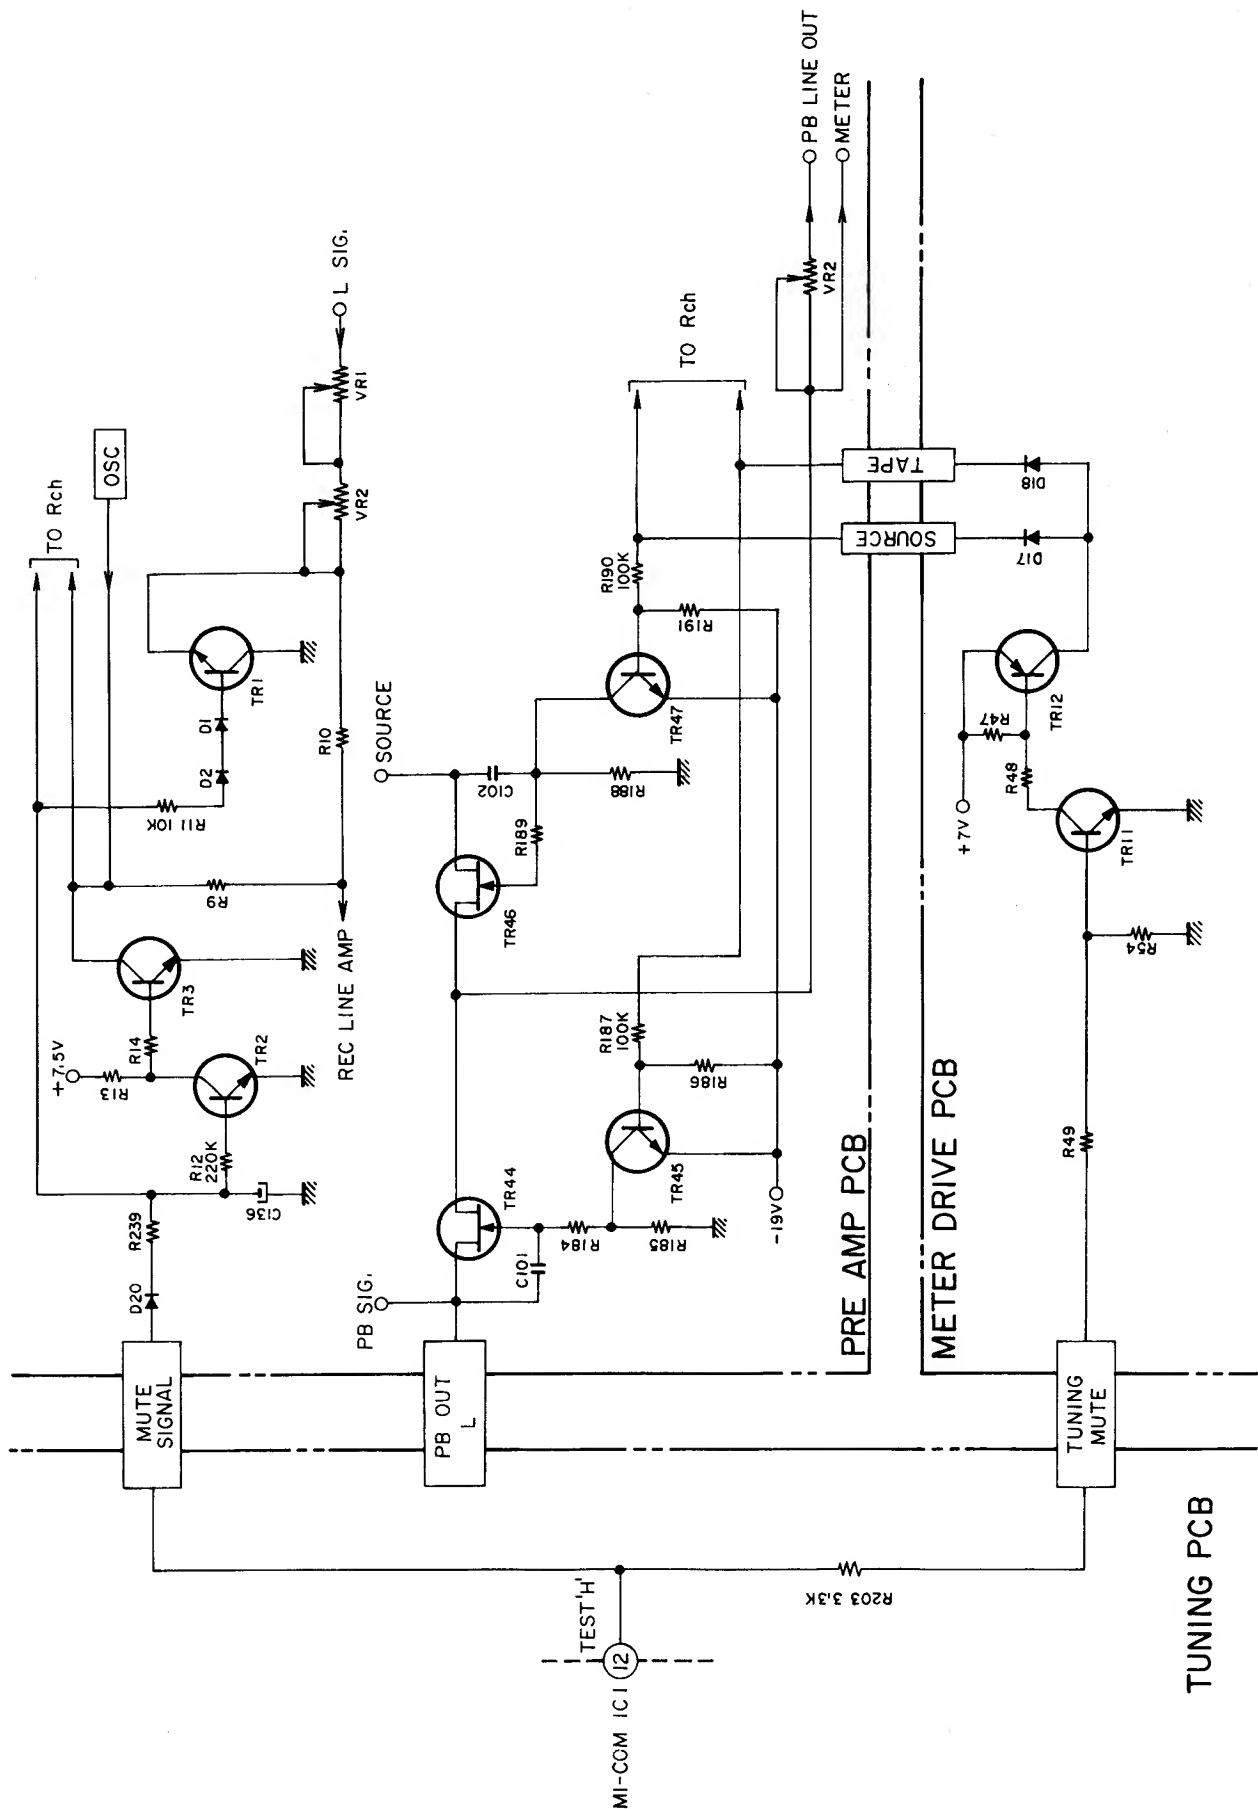

Fig. 1-12 Mute Circuit

4-8. Reference Signal Generation Circuit (Refer to Fig. 1-13)

This circuit generates the reference signals (1K, 7K, 13K and 15K) at the time of tuning.
The oscillation frequency of the TEST signal is controlled by way of pins 22 and 23 (OSC, FRQ I and II) of the Mi-Com. The 2 bit signal is used to

generate 1K, 7K, 13K and 15K.
In the above truth table, "H" causes TRs 58, 61 and 62 to be activated.
13 kHz is used for NORMAL TEST, while 15 kHz is used for CrO₂ or METAL.
The reference oscillation output level is adjusted by VR9.

No.		OSC stopped	1 kHz	7 kHz	13 kHz	15 kHz		
24	OSC ON/OFF	L	H	H	H	H	⇒	TR58
22	FRQ I		L	L	H	H		TR61
23	FRQ II		L	H	L	H		TR62

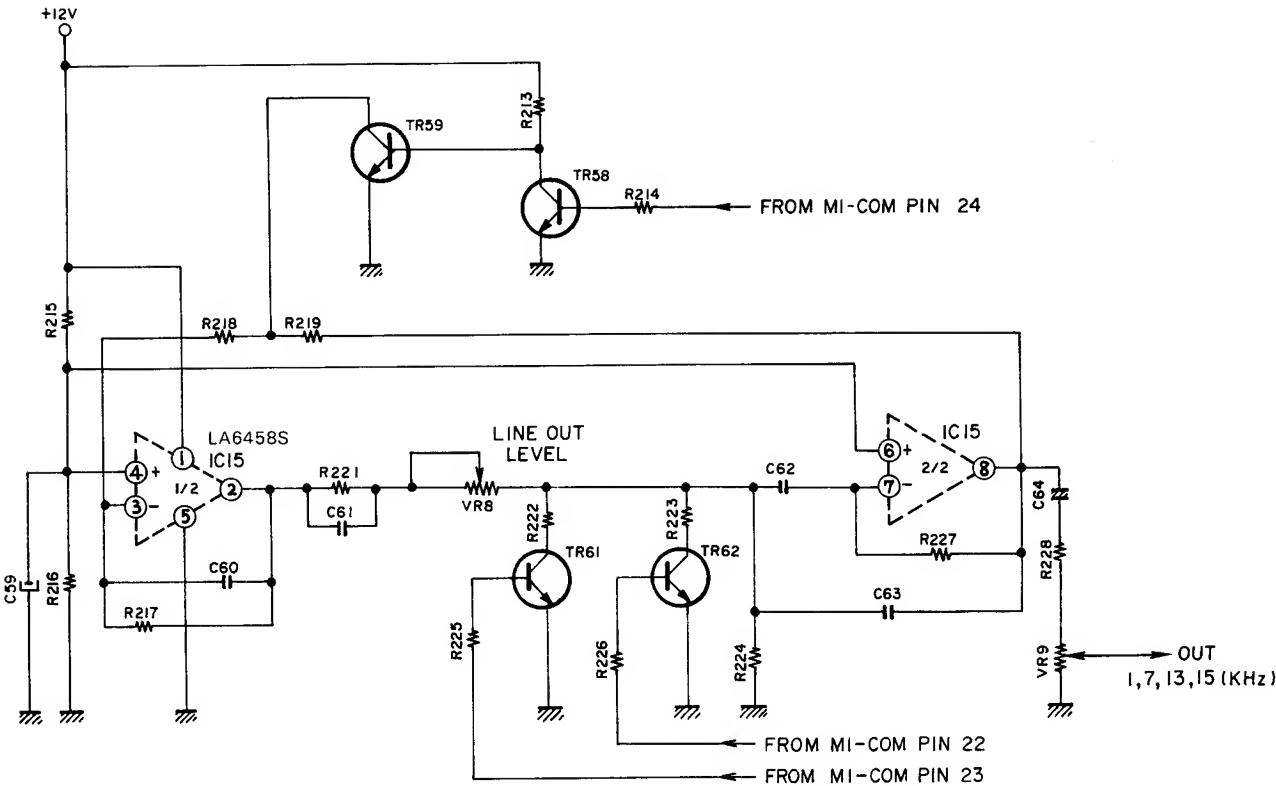

Fig. 1-13

4-9. A/D Conversion Circuit (Refer to Fig. 1-14)

The purpose of this circuit is to detect the REC/PB level at the time of auto tuning.

- 1) Switching between Lch and Rch is made by turning TR64 on/off by way of Mi-Com's pin ①⑥ (L/R change-over SW control). (Lch : H ; Rch : L)
- 2) VR10 is for adjusting the A/D conversion level.

- 3) Pins ③ and ④ of IC5 are set to ON and the reference PB output level is supplied to pin ③② of the Mi-Com. Then, pins ⑧ and ⑨ of IC5 are set to ON and comparison is made with the previous data.
- 4) The PB output is integrated by the operation of TR63, and C65 is discharged for each test through resetting.

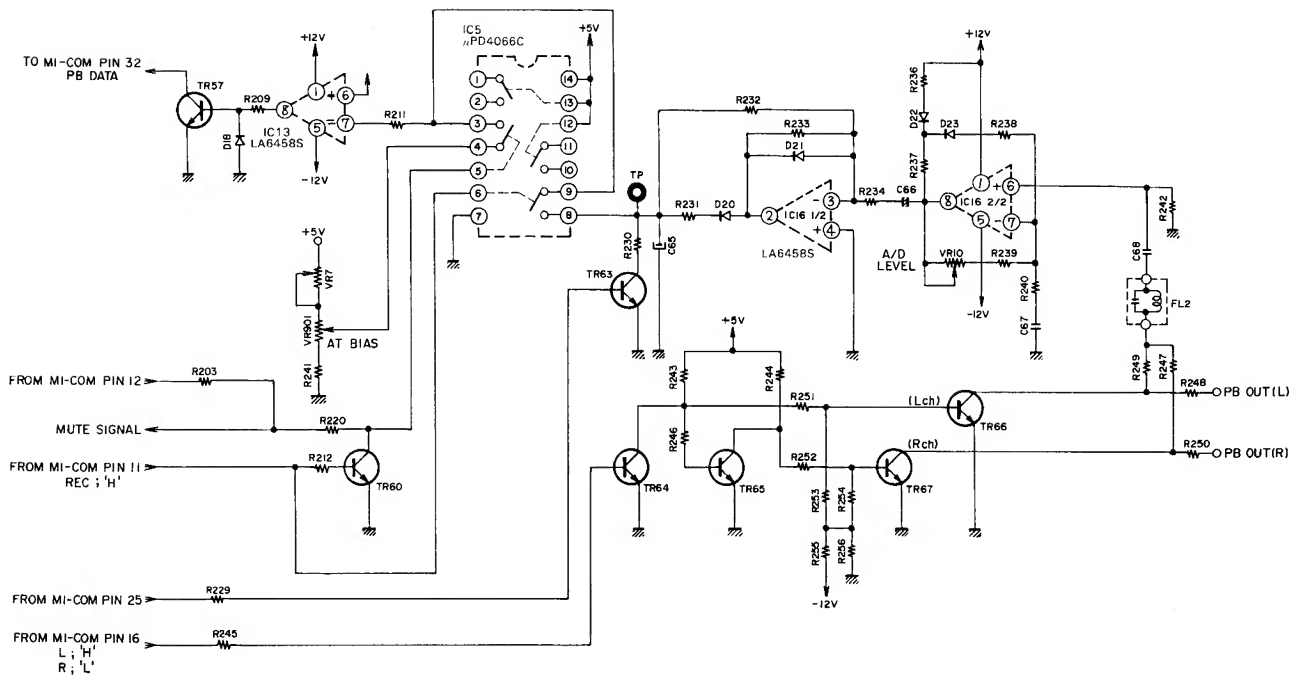

Fig. 1-14

4-10. Bias OSC Power Supply (Refer to Fig. 1-15)

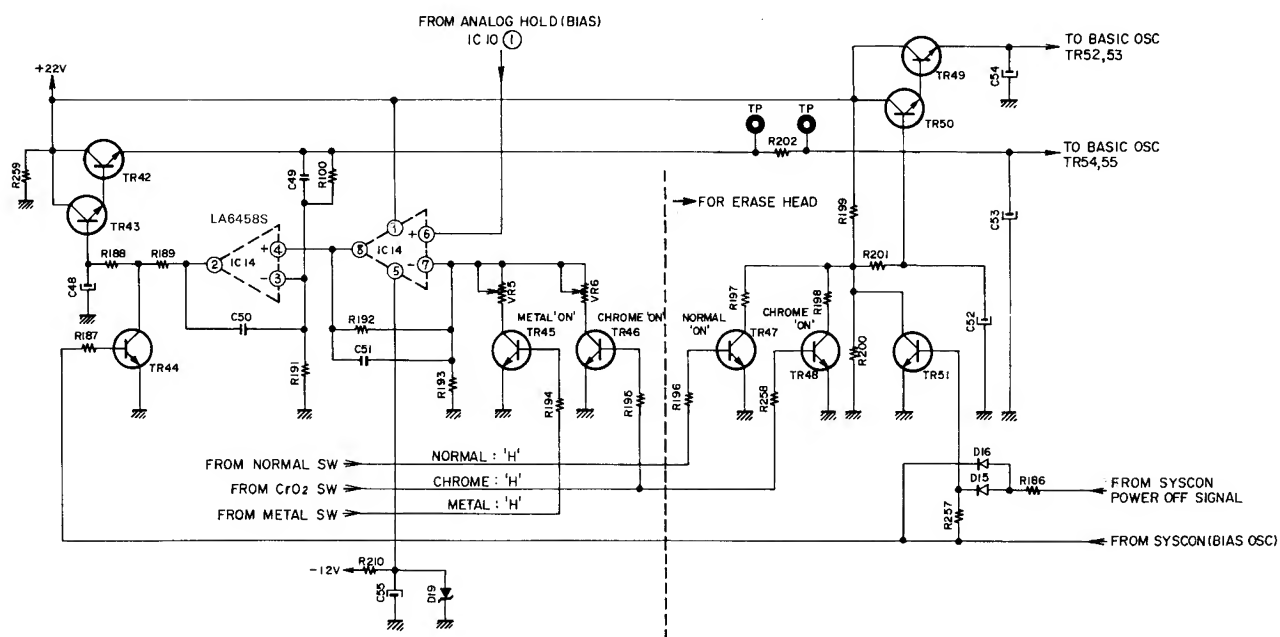

The purpose of this circuit is to supply power to the bias OSC.

1) Bias

- (1) The AC component is removed by C50 and C51.
- (2) VR5 (METAL) and VR6 (CrO₂) are for adjusting the bias.
- (3) The output is killed by TR44. (OFF during REC mode)
- (4) Oscillator voltage is changed through control by TR43.

2) Erase head

- (1) Settings are made based on METAL. For NORMAL or CrO₂, voltage is changed by means of TR46 and TR48, respectively.
- (2) The output is killed by TR51. (OFF during REC mode)
- (3) Oscillator voltage is changed through control by TR50.

III. AMPLIFIER

1. AMP BLOCK DIAGRAM

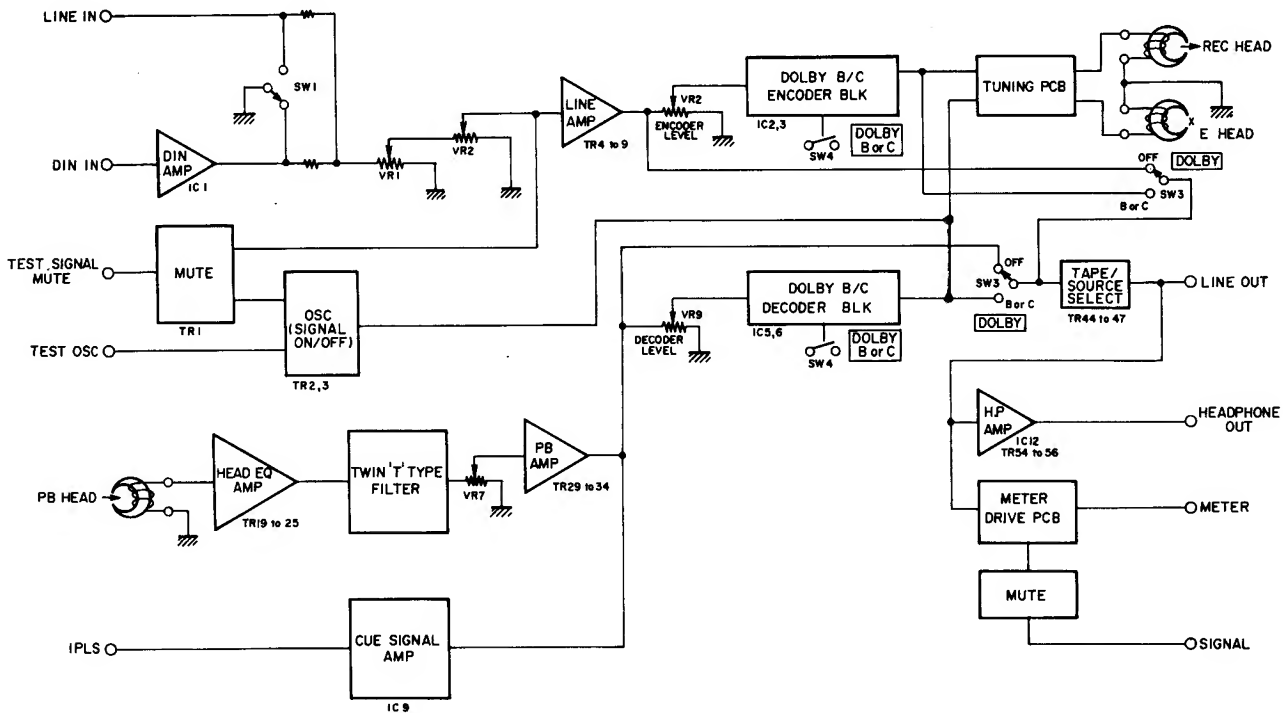

Fig. 1-16

2. PB HEAD EQ AMP (Fig. 1-17)

The PB signal from the PB head is amplified by AMP 1 (differential amp) and then make negative feed back through R103, R104, R106 and R95.

The amplified signal is subjected to DC balancing with VR4 (100B) of AMP 1. The DC balance of the entire AMP 1 is once again set up by VR6 on the "source" side of TR25.

Subsequently, the signal is routed to VR7 via a filter (R110, R111, R112, C52, C53, and C54). (With CrO₂ or METAL, TR27 is activated and the PB high-range EQ curve is changed to a 70 msec time constant with C55, R113 and R114.)

The signal is then adjusted by VR7 (PB LEVEL) before being sent to LINE OUT via AMP 2 (with Dolby IC or Dolby OFF). R134 and R126 of AMP2 provide NF.

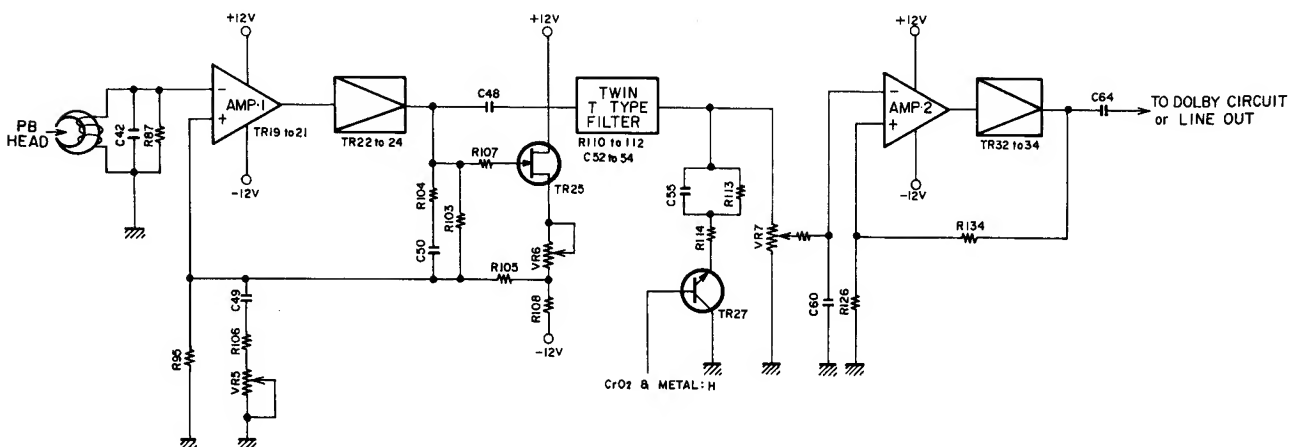

Fig. 1-17

3. TAPE/SOURCE MONITOR SWITCHING AND MUTE CIRCUITS (Refer to Fig. 1-18)

PB MUTE terminal :

L' (PLAY only), H' (others),

causes TR2 OFF and TR1 OFF.

S (H) terminal "L", Pre amp, TR45 OFF, TR44 ON and PB ON.

PLAY terminal :

Signal (as determined by com-

combined time constants of R58 and C13) activates TR15 and ⑥ of IC1 is set to "L".

Because of IC1 [NAND], ④ of IC1 → "H" and ③ of IC1 → "L".

Thus, TR17 OFF, and TR16 ON.

L' to SOURCE IND, and H' to TAPE IND.

Rec/PLAY terminal :

TR13 OFF, TR14 ON, ① of

IC1 → L', ③ of IC1 → H, TAPE IND → L, and SOURCE IND → H'.

Power ON MUTE :

TR3 ON { ⑨ of IC5 → H' and ⑩ → L' and then TAPE MONITOR comes on. MUTE on pre amp side via D33, D2 and D1, resulting in both TAPE and SOURCE being muted.

Power OFF MUTE :

At power OFF time, TR4 is activated by charging current (C2); MUTE on pre amp side via D1 and D2.

TAPE WINDING TIME	90 sec. using a C-60 cassette tape
FREQUENCY RESPONSE	Normal: 20 to 18,000 Hz \pm 3 dB (-20 VU) CrO ₂ : 20 to 19,000 Hz \pm 3 dB (-20 VU) Metal: 20 to 21,000 Hz \pm 3 dB (-20 VU)
SIGNAL TO NOISE RATIO	Metal: Better than 60 dB (measured via tape with peak recording level) Dolby B-type NR switch ON: Improves up to 5 dB at 1 kHz, 10 dB above 5 kHz Dolby C-type NR switch ON: Improves up to 15 dB at 500 Hz, 20 dB at 1 kHz to 10 kHz
HARMONIC DISTORTION	1 kHz, 3rd harmonic distortion Metal: Less than 0.8%
INPUT	Line: 70 mV (input impedance: 47 kohms)
OUTPUT	Line: 410 mV at 0 VU Required load impedance: more than 20 kohms Phone: 1.3 mW/8 ohms at 0 VU
DIN	Input: 2.0 mV (input impedance: 10 kohms) Output: 410 mV Required load impedance: more than 20 kohms
POWER REQUIREMENTS	100V, 50/60 Hz for Japan 120V, 60 Hz for USA and Canada 220V, 50 Hz for Europe except UK 240V, 50 Hz for UK and Australia 110V/120V/220V/240V, 50/60 Hz switchable for other countries
POWER CONSUMPTION	39W
DIMENSIONS	440 (W) \times 100 (H) \times 363 (D) mm (17.3 \times 3.9 \times 14.3")
WEIGHT	9.8 kg (21.6 lbs)

IV. PRINCIPAL PARTS LOCATION

Fig. 2-5 Front View

Fig. 2-6 Top View

Fig. 2-7 Bottom View

V. VOLTAGE CONVERSION AND CYCLE CONVERSION

Fig. 2-8 Voltage Conversion (U Model)

1. VOLTAGE CONVERSION

Models for Canada, Europe, USA, UK, Australia and Japan are not equipped with this facility.

Each machine is preset at the factory according to destination, but some machines can be set to 110V, 120V, 220V or 240V as required.

If voltage change is necessary, this can be accomplished as follows:

- 1) Disconnect power cord.
- 2) Loosen holding screws and remove upper cover.
- 3) Remove short pin plug from present holes and replace in correct holes. Follow the markings explicitly.

2. CYCLE CONVERSION

With DC motor, cycle conversion is not necessary.

VI. MECHANICAL ADJUSTMENT

Fig. 2-9

1. PINCH ROLLER PRESSURE MEASUREMENT (Refer to Fig. 2-9)

Put in PLAY mode. Push pinch roller arm down with the spring gauge push the pinch roller 1 ~ 2 mm from the capstan and release slowly. Read the spring gauge at the moment the pinch roller touches the capstan and begins to rotate.

Specified pressure: 350 ± 50 gm (Take up)

200 ± 50 gm (Supply)

If there is no measurement obtained, replace the pinch roller spring.

Fig. 2-10

2. HOW TO INSTALL VOLUME (VR901) AND CAM WHEEL

- 1) Apply Molybdenum coat on the capstan holder
Apply Molybdenum coat on the area of 360° from the bottom to the upside 2 mm of groove as shown in the figure. (Fig. 2-10-①)
- 2) Fitting position volume (potentio gear)
Fit the right end of Mark (A) to the center of Mark (B) as shown in the figure. (Fig. 2-10-②)
- 3) Apply Molybdenum coat on (A), (B) and (C) shown in Fig. 2-10-③.

- 4) Set the cam wheel on the capstan wheel
(Ensure that the cam wheel and potentiometer gear are meshed properly). When the cam wheel is set properly, fit the center of Mark (D) to the right end of Mark (C). (Fig. 2-10-④)
- 5) Fit the stopper ring in the groove of the capstan holder.

CAUTIONS:

1. Make sure that the teeth on the periphery of cam wheel and the cam are absolutely free from any scratch, flaw, cut, etc.
2. Make sure that Molybdenum coat is applied on the specified area only.

Fig. 2-11

3. POTENTIOMETER PRESET VOLTAGE ADJUSTMENT (Refer to Fig. 2-11, 12)

1) LOW VOLTAGE ADJUSTMENT

- With power OFF, remove the connecting cord of the cam motor and turn the operate pulley fully with your fingers in A direction.
- Connect the digital voltmeter as shown in Fig. 2-11.
- With power ON, adjust VR2 so that the voltage reading will be 0.78V (DC).

2) HIGH VOLTAGE ADJUSTMENT

- With power OFF, turn the operate pulley fully with your fingers in B direction.
- With power ON, adjust VR1 so that the voltage reading will be 6.73V (DC).

3) Repeat Items 1) and 2).

- With Power OFF, connect the connecting cord of the motor.
 - Remove the digital voltmeter.

Fig. 2-12 Position of Operate Pulley in STOP Mode

- Set power to ON.
 - Adjust VR1 slightly so that a center line between windows of the operate pulley will face directly above during STOP Mode. (Fig. 2-12)
 - Remove the cassette lid and set the AUTO SYSTEM switch to IPLS Mode.
 - Confirm that the head and pinch roller do not move up and down when the FF and REW switches are alternately depressed.
 - Turn the reel with fingers in TOP Mode to check that the brake works sufficiently. When the brake acts normally, the take-up reel does not turn clockwise while the supply reel does not rotate counterclockwise.

VII. HEAD ADJUSTMENT

Fig. 2-13

Fig. 2-14 Cassette Head Projection Gauge (TF-111CJ)

Fig. 2-15 Mirror Cassette Tape (TF-109CM)

1. REC/PB HEAD PROJECTION

ADJUSTMENT

Set the cassette head projection gauge (TF-111CJ) and set to PLAY mode. Loosen the screw (a) and adjust so that the gauge indication at that time will be 3.2 ± 0.05 mm. After adjustment, apply paintlock on the screw (a).

2. TAPE GUIDE HEIGHT ADJUSTMENT

- 1) Set the mirror cassette tape (TF-109CM) and set to PLAY mode.
- 2) Adjust the tape guide (A) so that the parts of the erase head coming out of both sides of the tape (A and A' in Fig. 2-13) will be equal. For the adjustment, use the adjustment nut (A).
- 3) Adjust the tape guide (B) so that the tape runs smoothly and is not hitched by the tape guide. For the adjustment, use the adjustment nut (B).
- 4) After adjustment, paint-lock the adjustment nuts (A) and (B).

3. REC/PB HEAD HEIGHT ADJUSTMENT

- 1) Set the mirror cassette tape and set to PLAY mode.
- 2) Adjust the screws (b), (c) and (d) so that the upper edge of REC/PB head Lch core and the upper side of the tape is in alignment.
- 3) Playback the head height adjustment tape (4Tr 1,000 Hz) (TF-103CF), and fine-adjust the screws (b), (c) and (d) so that the largest output is obtained for both channels.

4. REC/PB HEAD AZIMUTH ALIGNMENT

ADJUSTMENT

- 1) Playback a 10 kHz Head Azimut Alignment Tape (TF-106CH) and adjust the screw (d) until the output levels of both channels are at maximum.
- 2) Record a 10 kHz, -20VU signal from the audio frequency oscillator.
- 3) Rewind and check for any fluctuation in the output level at playback.
- 4) After adjustment, paintlock the screws (b), (c) and (d).

NOTES:

1. Be sure to clean the heads prior to head adjustment.
2. Be careful not to use a magnetized driver or other magnetized tools in the vicinity of the heads.
3. Be sure to demagnetize the heads with a Head Demagnetizer before and after head adjustment.

VIII. PRE AMP PCB ADJUSTMENT

- NOTES: 1. The parts with the mark * can be adjusted on the opposite (pattern) side, too.
2. ↻ indicates the level increasing direction.

Fig. 2-16 Pre Amp PCB (Parts Side View)

1. PB DIFFERENTIAL AMPLIFIER OFF-SET VOLTAGE ADJUSTMENT (Fig. 2-16)

1) PB EQ AMP

- Connect point A to GND.
- Adjust VR4 so that the voltage to GND of TP1 will be 0 ± 500 mV DC.
- Remove the connecting cord of the point A.
- Adjust VR6 so that the voltage to GND of TP1 will be 0 ± 10 mV DC.

2) PB LINE AMP

- Adjust VR8 so that the voltage to GND of TP2 will be 0 ± 10 mV DC.

3) REC LINE AMP

- Adjust VR1 so that the voltage to GND of TP3 will be 0 ± 10 mV DC.

2. PB EQ AMP ADJUSTMENT (Fig. 2-16)

1) PB LEVEL

Play back 333 Hz PB level adjustment tape (TF-101CL) and adjust VR7 so that the LINE OUT level will be -5.5 ± 0.2 dBm.

2) PB EQ

Play back 10 kHz PB EQ adjustment tape (TF-106CH) and adjust VR5 so that the LINE OUT level will be -22.5 ± 1.5 dBm.

3. DOLBY ENCODER ADJUSTMENT

(Fig. 2-16)

1) ENCODER LEVEL

- With the monitor SW to SOURCE, input signal of 400 Hz into the LINE INPUT and adjust the input level so that the level of TP4 will be -2.5 ± 0.1 dBm (580 mV) when Dolby is OFF.
- Adjust VR2 so that the level of TP4 will be the same level as a. (-2.5 ± 0.1 dBm) when Dolby B-type is ON.
- Adjust VR3 so that the level of TP4 will be the same level as a. (-2.5 ± 0.1 dBm) when Dolby C-type is ON.

2) MPX Filter Adjustment

- With the monitor SW to SOURCE and MPX filter SW "OFF", input a signal of 19 kHz from LINE IN.
- Adjust FL3 so that the LINE OUT level will be at minimum when MPX filter SW is turned ON.

3) BIAS Filter Adjustment

- Input a signal of 100 kHz from LINE IN.
- Adjust FL2 so that the LINE OUT level will be at minimum.

4. DOLBY DECODER ADJUSTMENT

(Fig. 2-16)

1) DECODER Level Adjustment

- Set a S/N pack (NOTES: 3) and set to PLAY mode.
- Input the signal of 400 Hz into TP5 and adjust the input level so that the LINE OUT level will be -2.5 ± 0.1 dBm (580 mV) when Dolby is OFF.
(Audio oscillator is connect to TP5 and GND of the Pre Amp PCB).
- Adjust VR9 so that the LINE OUT level will be the same level as a. (-2.5 ± 0.1 dBm) when Dolby B-type is ON.
- Adjust VR10 so that the LINE OUT level will be the same level as a. (-2.5 ± 0.1 dBm) when Dolby C-type is ON.

2) BIAS Filter Adjustment

- Set a S/N pack (NOTES: 3) and set to PLAY mode.
- Input the signal of 100 kHz into TP5.
(Audio Oscillator is connect to TP5 and GND of the Pre Amp PCB).
- Adjust FL4 so that the level of IC5 ③ will be at minimum.

NOTES:

- A digital voltmeter should be used for the measurement of DC voltage and an AC voltmeter (mV meter) for the measurement of AC voltage, and the input impedance should be 10 Mohms or more.
- Output level control should be at maximum.
- The S/N pack allows only the pad to contact the head with a cassette tape cut or removed, and is used so the head will not pick up noise.

IX. TUNING PCB ADJUSTMENT

- NOTES: 1. The parts with the mark * can be adjusted on the opposite (pattern) side, too.
2.  indicates the level increasing direction.

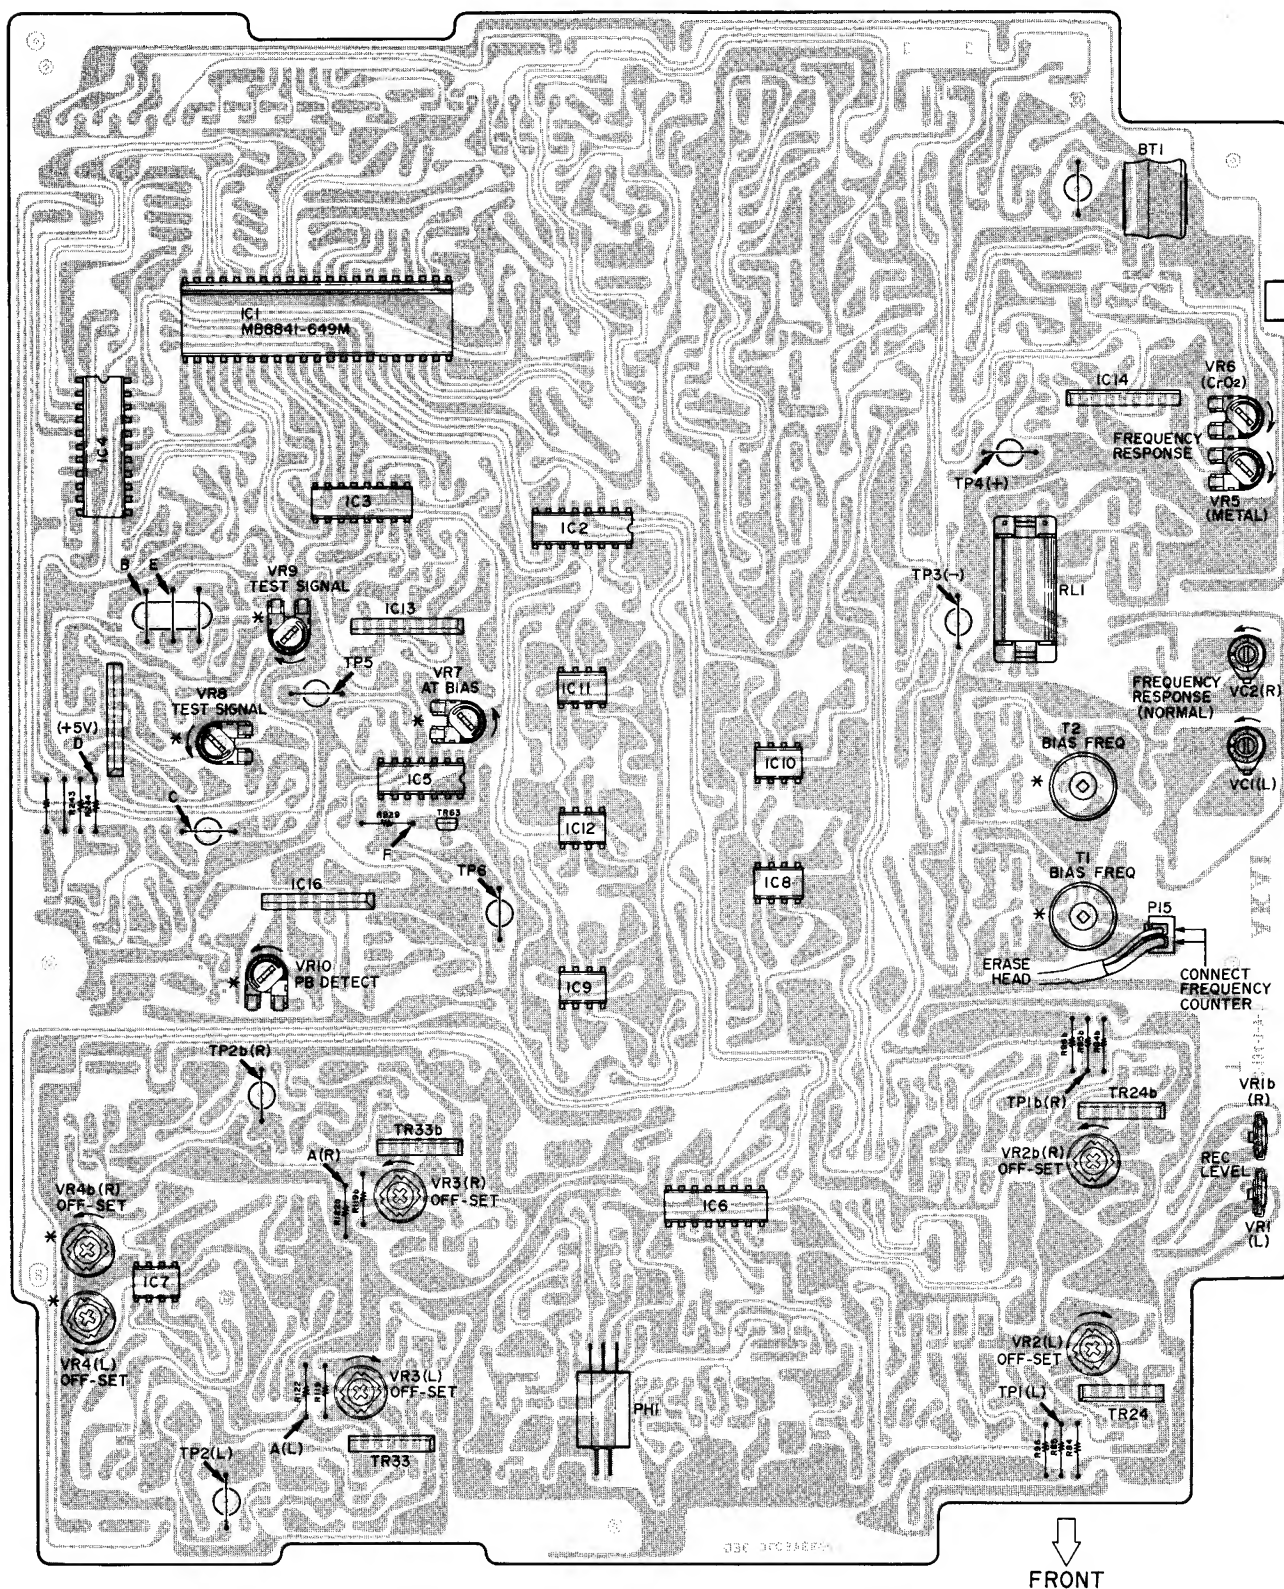

Fig. 2-17 Tuning PCB (Parts Side View)

1. REC DIFFERENTIAL AMPLIFIER OFF-SET VOLTAGE ADJUSTMENT

(Fig. 2-17)

- 1) Adjust VR2 so that the voltage to GND of TP1 will be 0 ± 10 mV DC.
- 2) Connect point A to GND.
- 3) Adjust VR3 so that the voltage to GND of TP2 will be 0 ± 500 mV DC.
- 4) Remove the connecting cord of the point A.
- 5) Adjust VR4 so that the voltage to GND of TP2 will be 0 ± 2 mV DC.
(Becarful to make this adjustment, otherwise DC current will through the REC Head).

2. REC BIAS OSC ADJUSTMENT (Fig. 2-17)

- 1) Set a metal tape and set to REC/PLAY mode.
- 2) Set VC1 and VC2 as shown in Fig. 2-17.
- 3) Connect the frequency counter to P15 (Tuning PCB) and adjust T1 so that the frequency will be 100 ± 0.2 kHz.
- 4) Connect a DC voltmeter between TP3 (-) and TP4 (+) and adjust T2 so that the voltage will be at minimum. (Less than 50 mV DC)

3. FREQUENCY RESPONSE ADJUSTMENT

(Fig. 2-17)

- 1) Record and play back 1 kHz/10 kHz, -25.5 dBm using a normal tape and adjust VC1 (L) and VC2 (R) so that 1 kHz/10 kHz will be 0 ± 0.5 dBm (provided L-R difference is within 0.5 dBm).
- 2) Record and play back 1 kHz/10 kHz, -25.5 dBm using a CrO₂ tape and adjust VR6 so that 1 kHz/10 kHz will be 0 ± 0.5 dBm.
- 3) Record and play back 1 kHz/10 kHz, -25.5 dBm using a metal tape and adjust VR5 so that 1 kHz/10 kHz will be 0 ± 0.5 dBm.

4. RECORDING LEVEL ADJUSTMENT

(Fig. 2-17)

Record and play back 1 kHz, -5.5 dBm using a normal tape, and adjust VR1 so that the difference between recording and playback levels will be 0 ± 0.3 dBm.

5. TEST SIGNAL ADJUSTMENT (Fig. 2-17)

- 1) Connect point B to GND.
- 2) Connect point C to point D (+5V).
- 3) Set to REC/PAUSE mode, adjust VR8 so that the LINE OUT level will be same level, when point E is connected to GND and when they are not connected.
- 4) Connect point E to GND and adjust VR9 so that the LINE OUT level will be -33.0 ± 0.2 dBm.

6. AT (ATUO TUNING) BIAS STANDARD VOLTAGE ADJUSTMENT (Fig. 2-17)

- 1) Set the AT BIAS volume to center (click position).
- 2) Adjust VR7 so that the voltage to GND of TP5 be 2.5 ± 0.2 V DC.

7. LEVEL ADJUSTMENT OF PLAYBACK OUTPUT LEVEL DETECTION CIRCUIT

(Figs. 2-16. 17)

(A/D Converter Analogue Level Adjustment)

- 1) Set a S/N pack (NOTES: 4) and set to PLAY mode.
- 2) Input a signal of 1 kHz into TP5 of Pre Amp PCB and adjust the input level so that the LINE OUT level will be -32.5 ± 0.2 dBm.
(Audio Oscillator is connect to TP5 and GND of the Pre Amp PCB).
- 3) Connect point F to GND.
- 4) Adjust VR10 so that the voltage to GND of TP6 will be 2.5 ± 0.05 V DC.

NOTES:

1. Using a digital voltmeter for the measurement of DC voltage and an AC voltmeter (mV meter) for AC voltage measurement, the input impedance should be 10 Mohms or more.
2. Output level control should be at maximum.
3. Use the following cassette measuring tapes:
Normal Tape : Maxell UD C-60
CrO₂ Tape : TDK SA C-60
Metal Tape : TDK MA C-60
4. The S/N pack allows only the pad to contact the head with a cassette tape cut or removed, and is used so the head will not pick up noise.

X. METER DRIVE PCB ADJUSTMENT

Fig. 2-18 Meter Drive PCB (Parts Side View)

1. METER ADJUSTMENT (Fig. 2-18)

1) VU Meters

- Set the meters to VU, and select the REC/PAUSE mode.
- Input a 1 kHz signal to LINE IN, and adjust the input level so that the LINE OUT level will be -5.5 dBm.
- Adjust VR1 to a ground voltage of $1.92 \sim 1.93$ V DC at TP1.
- Adjust VR2 so that the meter $+1$ dB is turned off when the LINE OUT level is reduced to -5.2 dBm.

2) PEAK I and PEAK II Operation Confirmation

- Take Steps 1) -a and 1) -b above.
- Check that the PEAK I and PEAK II meter readings are 0 ± 1 dB.

- Switch input on and off, and confirm that PEAK II does peak-hold, but that PEAK I does not peak-holds.

3) D. COMP Operation Confirmation

- Set the meters to VU, and select the REC/PAUSE mode.
- Input a 10 kHz signal so the meters read -10 dB.
- Confirm that, when the D-COMP button is depressed after loading a normal or CrO_2 tape, the meters read -2 ± 2 dB (difference between L and R less than 2 dB).
- Load a metal tape, and confirm that the meters read -3 ± 2 dB (difference between L and R less than 2 dB) in the D-COMP mode.

XI. DC RESISTANCE OF HEADS

Description	Name	DC Resistance
REC/PB Head	PR4-5	PB: 340 ohms \pm 10% REC: 320 ohms \pm 10%
Erase Head	E-3621-PR	2.5 ohms \pm 15%

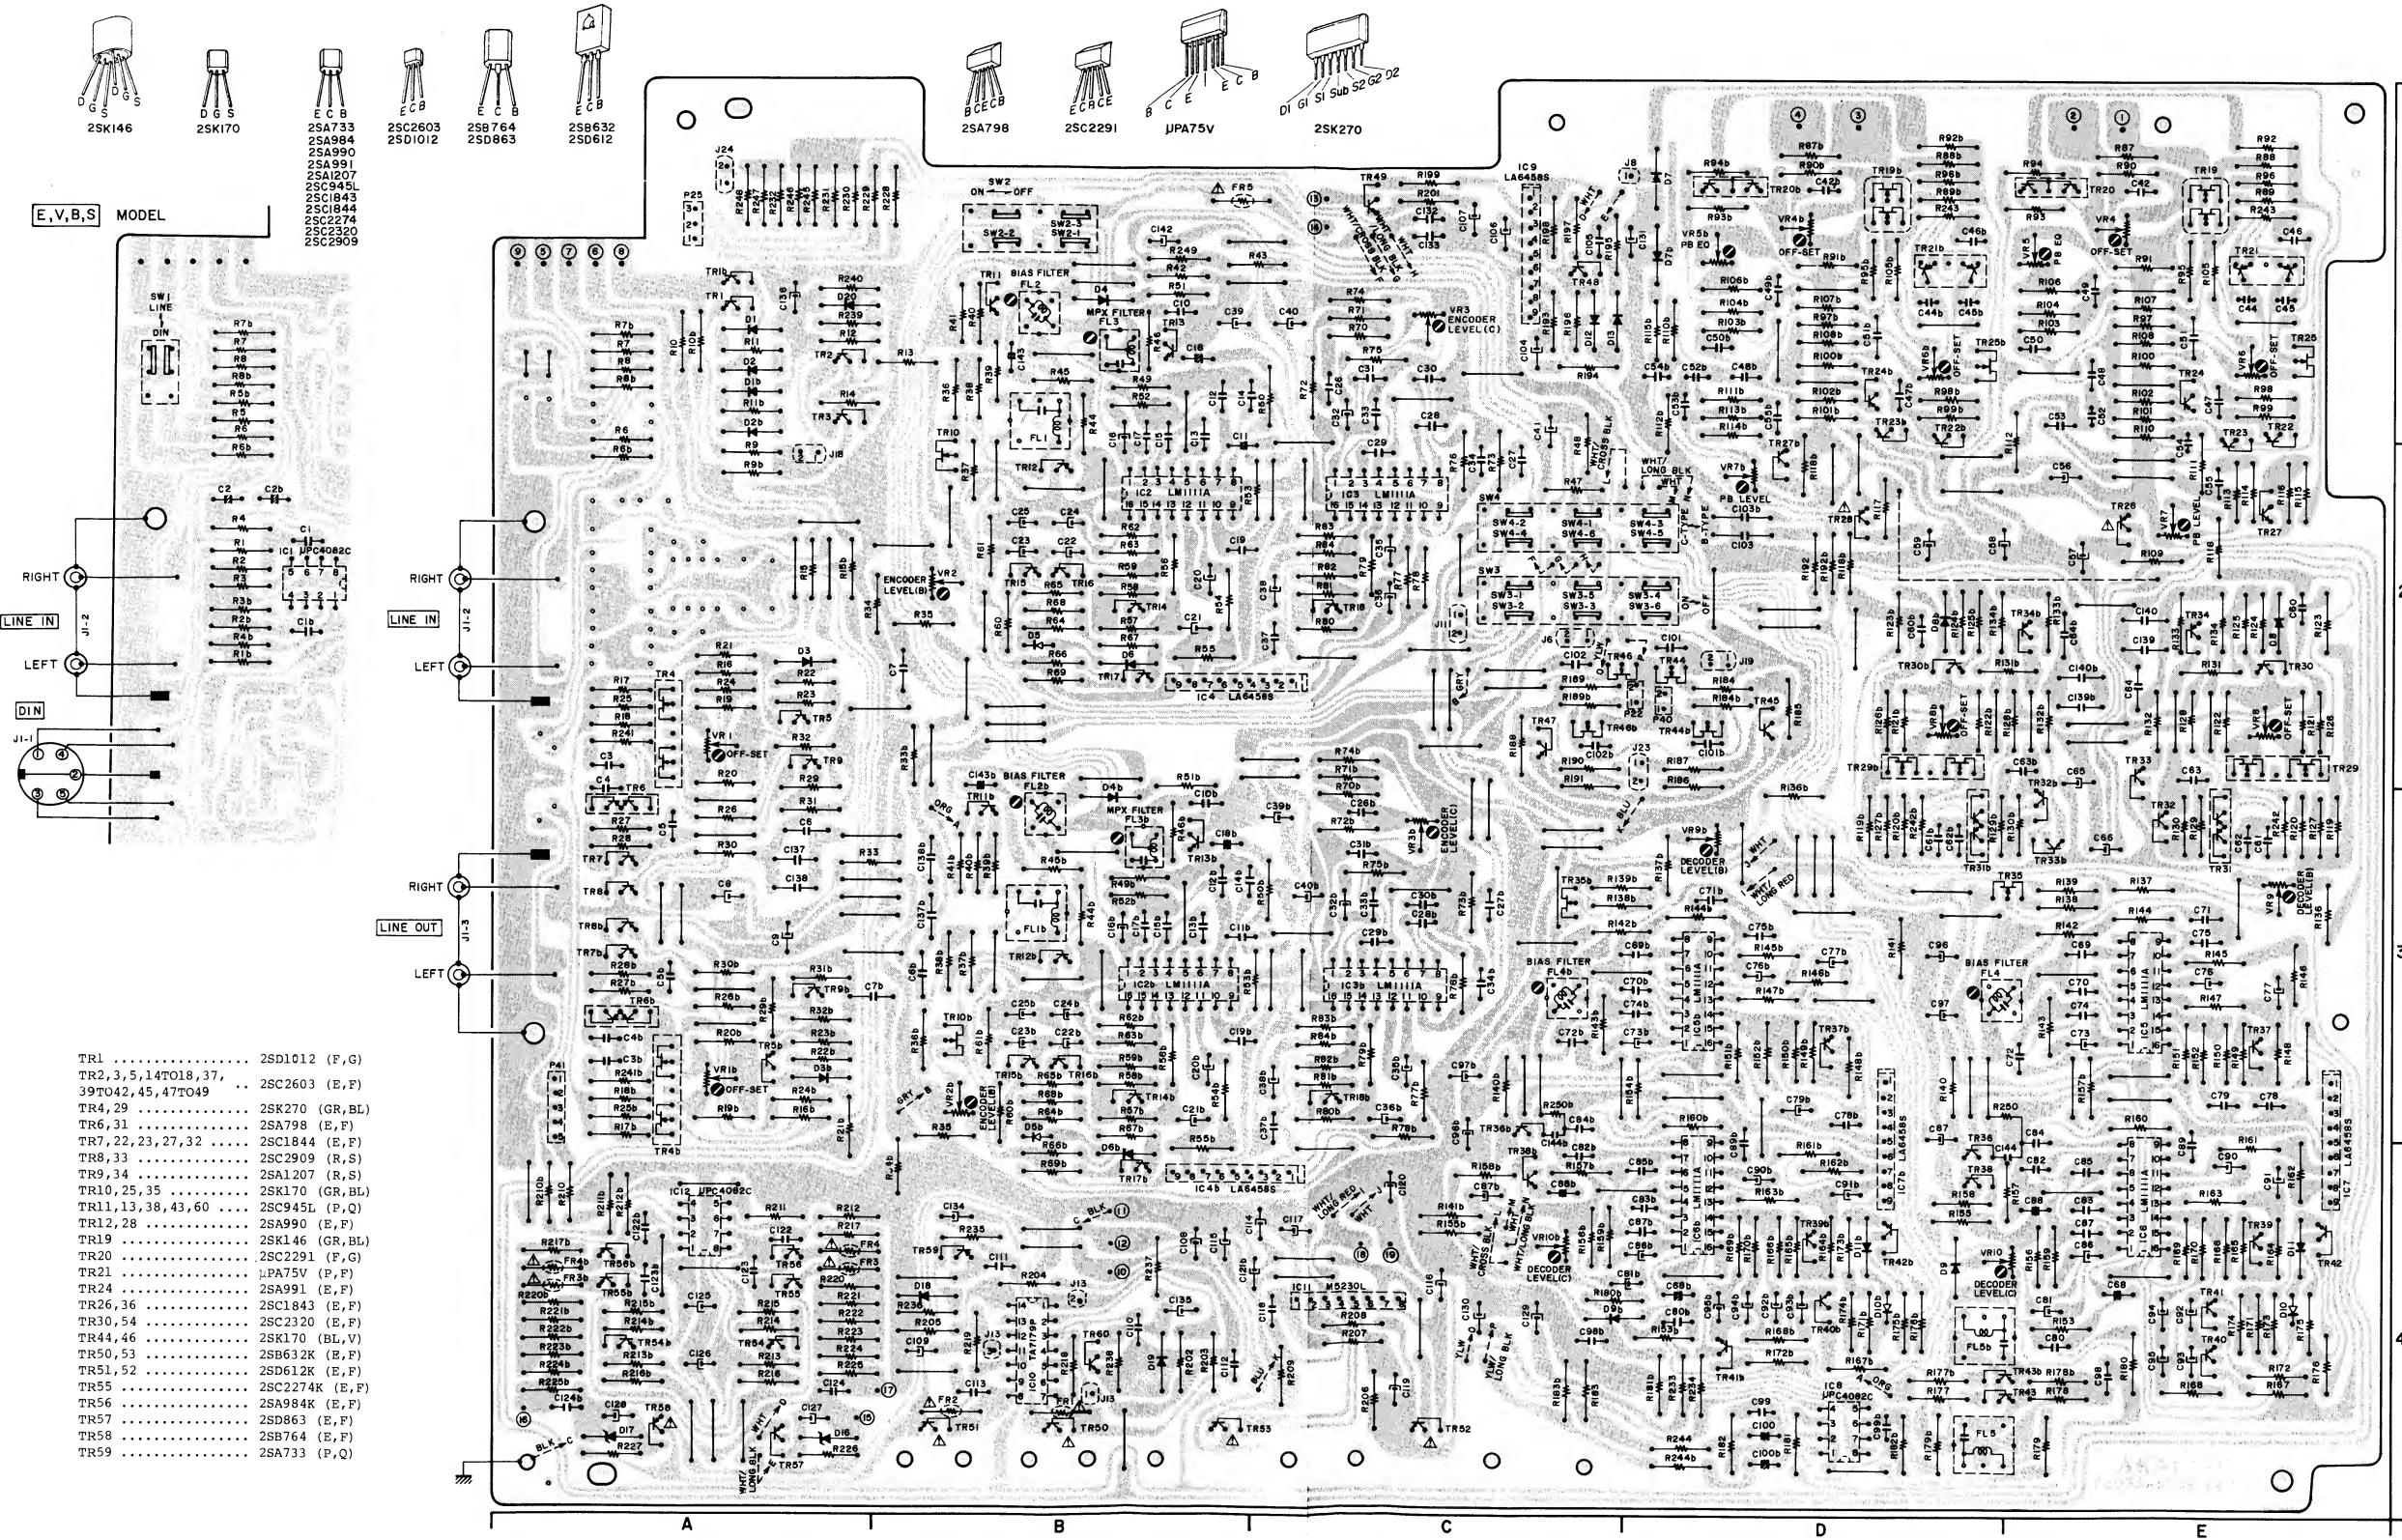

XII. CLASSIFICATION OF VARIOUS P.C BOARDS

INDEX	73

Resistor and Capacitor which is not listed in this parts list, please refer to COMMON LIST FOR SERVICE PARTS.

ATTENTION

1. When placing an order for parts, be sure to list the parts no., model no., and description. There are instances in which if any of this information is omitted, parts cannot be shipped or the wrong parts will be delivered.
2. Please be careful not to make a mistake in the parts no. If the parts no. is in error, a part different from the one ordered may be delivered.
3. Because parts number and parts unit supply in the Preliminary Parts List may be partially changed, please use this parts list for all future reference.

HOW TO USE THIS PARTS LIST

1. This Parts List shows the parts that are considered necessary for repairs. Other parts, such as resistors and capacitors, are shown in the "Common List for Service Parts". Select and order such parts from the "Common List for Service Parts".
2. The Recommended Spare Parts shows those parts in the Parts List which are considered particularly important for service.
3. Parts not shown in the Parts List and "Common List for Service Parts" will not be supplied in principle.
4. How to read list

a) Mechanism Block

b) P.C Board Block

2. HEAD BASE BLOCK

REF. NO.	PARTS NO.	DESCRIPTION

6-X1	EI-318384	OSC X'TAL NC-18C 3.579545MHZ

SP (Service Parts) Classification

This reference numbers corresponds with symbol numbers of Schematic Diagrams.

5. Both the kind of part and installation position can be determined by the Parts Number. To determine where a parts number is listed, utilize Parts Index at end of Parts List. It is necessary first of all to find the Parts Number. This can be accomplished by using the Reference Number listed at right of parts number in the Parts Index.

WARNING

⚠ INDICATES SAFETY CRITICAL COMPONENTS. FOR CONTINUED SAFETY, REPLACE SAFETY CRITICAL COMPONENTS ONLY WITH MANUFACTURER'S RECOMMENDED PARTS.

AVERTISSEMENT

⚠ IL INDIQUE LES COMPOSANTS CRITIQUES DE SURETE. POUR MAINTENIR LE DEGRE DE SECURITE DE L'APPAREIL NE REMPLACER LES COMPOSANTS DONT LE FONCTIONNEMENT EST CRITIQUE POUR LA SECURITE QUE PAR DES PIECES RECOMMANDEES PAR LE FABRICANT.

RECOMMENDED SPARE PARTS

Because, if the parts listed below are on hand, almost any repair can be accomplished, we suggest that you stock these Recommended Spare Parts Items.

The diagram illustrates the receiver system architecture. Key components and their connections include:

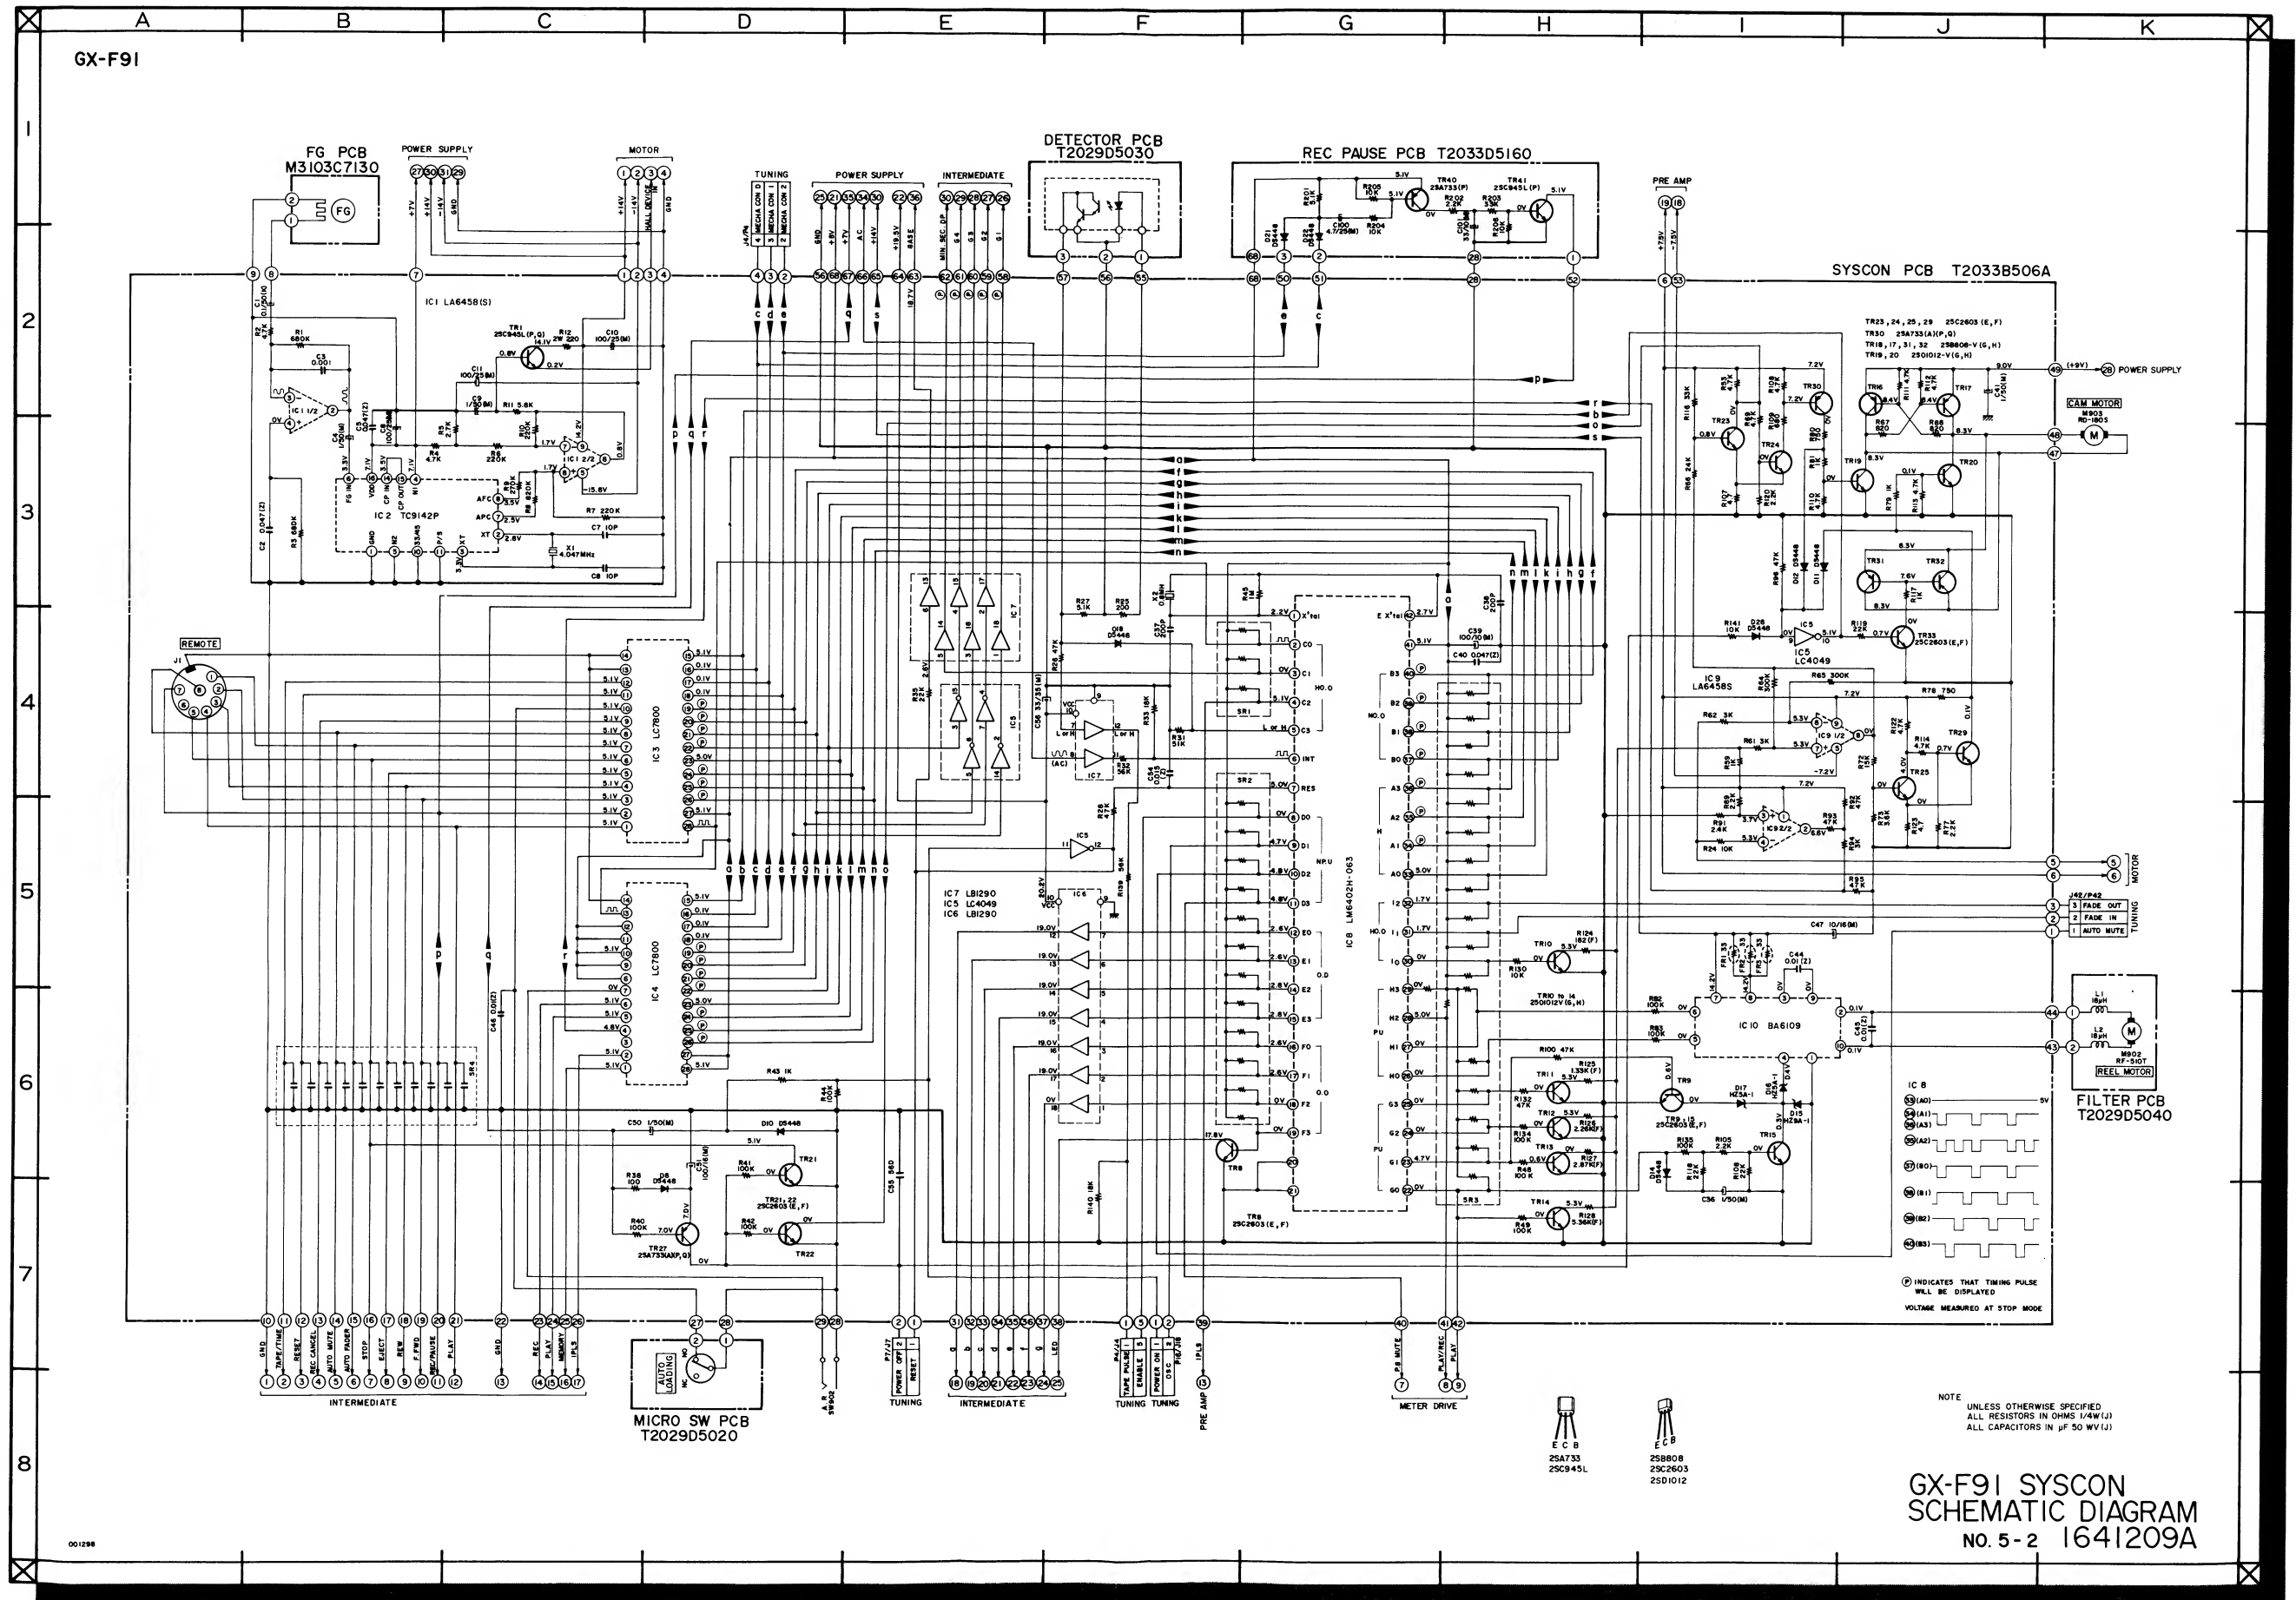

- Inputs:** X_T (3), X_T (2), N₁ (4), N₂ (5), CP_{OUT} (15), 33/45 (10), STROBO (13), LD (12), V_{DD} (16), GND (1), F_{GIN} (6), CP_{IN} (14), RV (9), and P/S (11).
- Initial Processing:** X_{Tal} OSC (3) and X_{Tal} (2) are connected to a feedback loop with R_f and R_{IN}. The output of the oscillator is fed into a $\frac{1}{N}$ STANDARD DIVIDER, which also receives N₁ and N₂. Its output (1/32 OUT) is connected to a $\frac{1}{20}$ OR $\frac{1}{27}$ DIVIDER, which also receives CP_{OUT} (15). The output of this divider is connected to a $\frac{1}{128}$ DIVIDER, which also receives 33/45 (10). The output of the $\frac{1}{128}$ divider is connected to STROBO (13).
- Timing and Control:** F_{GIN} (6) is connected to an Amp, which is connected to a SCHMIDT trigger. The output of the SCHMIDT trigger is connected to FG SYNC. CP_{IN} (14) is connected to the LOCK RANGE DET and the SPEED MONITOR & REVERSAL DET. The output of FG SYNC is connected to the AFC TIMING DIVIDER (12 BITS).
- Frequency Division:** The output of the $\frac{1}{128}$ divider is connected to the AFC TIMING DIVIDER (12 BITS). The output of the AFC TIMING DIVIDER is connected to the LOCK RANGE DET. The output of the LOCK RANGE DET is connected to the AFC 8BITS D/A CONV and the APC 8BITS D/A CONV.
- Speed Monitoring:** The output of the LOCK RANGE DET is connected to the SPEED MONITOR & REVERSAL DET. The output of the SPEED MONITOR & REVERSAL DET is connected to the $\frac{1}{2}$ DIVIDER, which also receives FG. The output of the $\frac{1}{2}$ divider is connected to the $\frac{1}{20}$ OR $\frac{1}{27}$ DIVIDER, which also receives CP_{IN} (14). The output of this divider is connected to the $\frac{1}{256}$ DIVIDER, which also receives RV (9). The output of the $\frac{1}{256}$ divider is connected to the APC 8BITS D/A CONV.
- Outputs:** The output of the AFC 8BITS D/A CONV is connected to AFC (8). The output of the APC 8BITS D/A CONV is connected to APC (7).

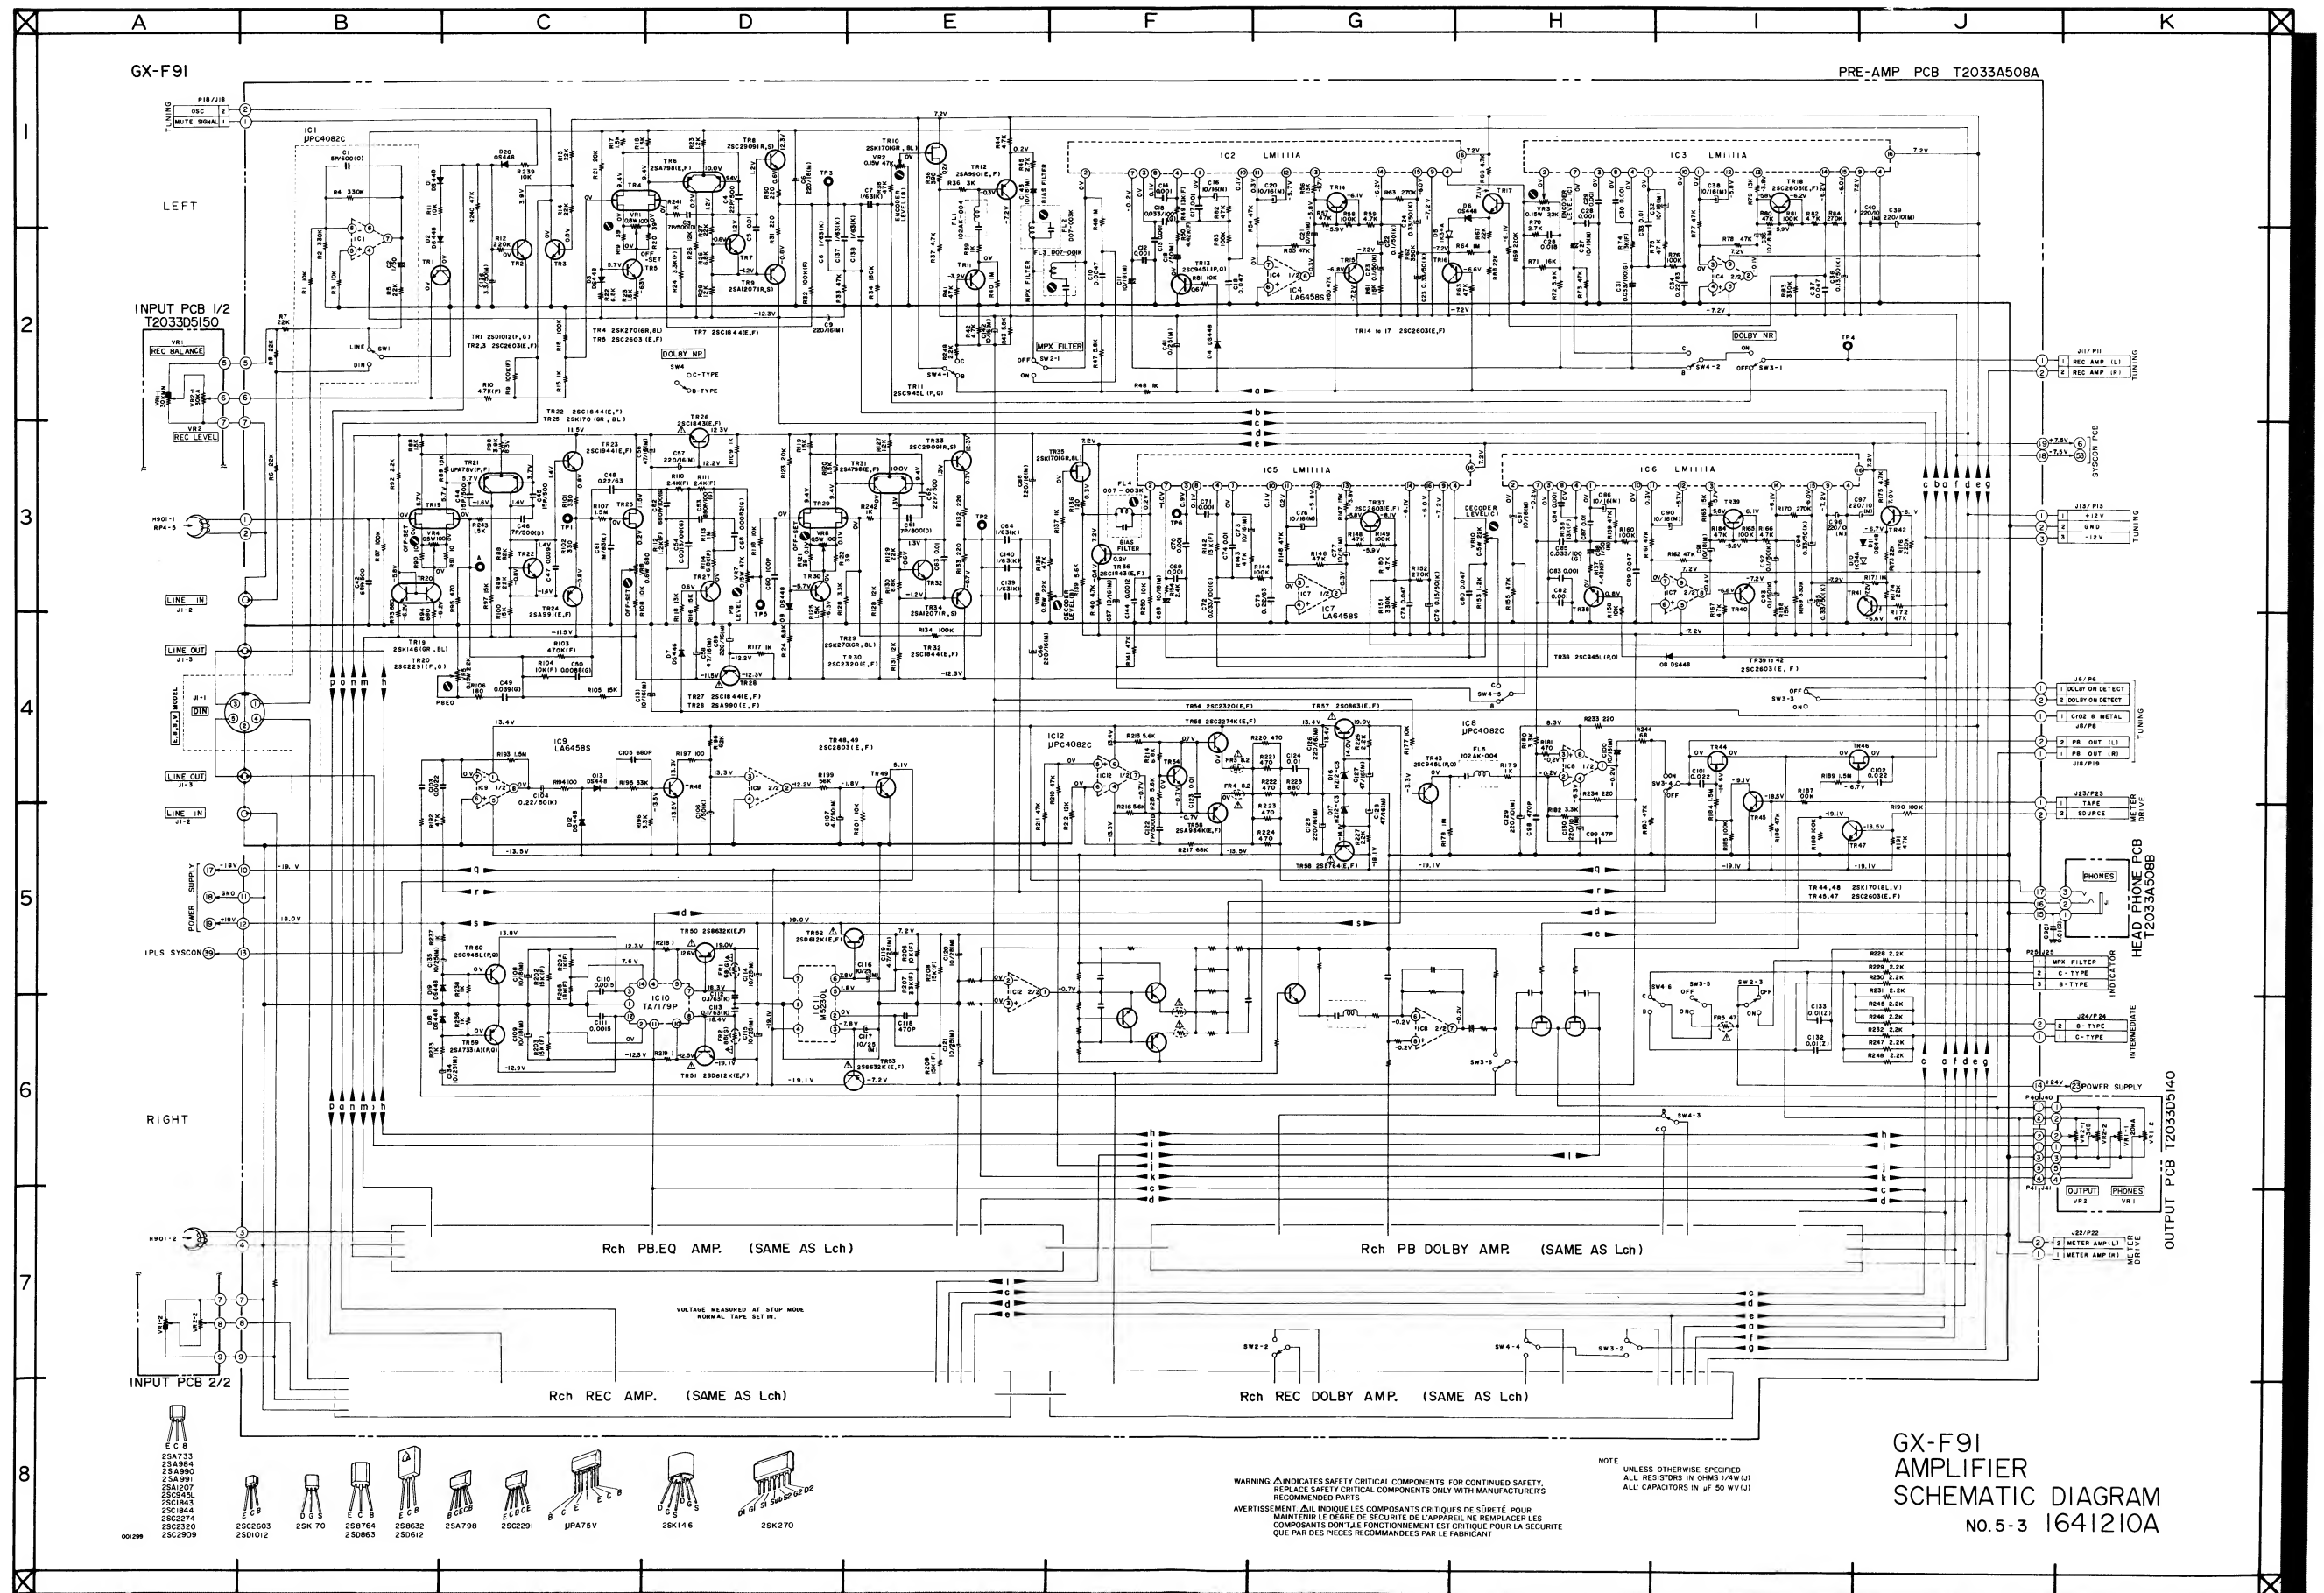

The diagram shows the internal structure of the 74VHC04B, which consists of two main blocks: a **LOGIC LEVEL CONVERSION** block and a **BINARY TO 1 OF 8 DECODER WITH INHIBIT** block. The **LOGIC LEVEL CONVERSION** block has inputs A (pin 11), B (pin 10), and C (pin 9), and an output INH (pin 6). The **BINARY TO 1 OF 8 DECODER WITH INHIBIT** block has inputs 7, 6, 5, 4, 3, 2, 1, and 0 (pins 4, 2, 5, 1, 12, 15, 14, 13 respectively), and outputs 7, 6, 5, 4, 3, 2, 1, and 0 (pins 4, 2, 5, 1, 12, 15, 14, 13 respectively). The decoder block also has an output labeled **COMMON OUT/IN** (pin 3). The diagram also shows the power supply pins: VDD (pin 16), VSS (pin 8), and VEE (pin 7).
